

//Demonstration using State

//Component (Student.jsx)

```
//State and event handling
import { useState } from "react";
const Student = () =>{
  const [name, setName] = useState("Vikas");
  const changeName = () =>{
    setName("Vikas Singh")
  }
  return(
    <div>
      <h1>My name is - {name}</h1>
      <button type="button" onClick={changeName}>click me</button>
    </div>
  )
}
```

```
importing CSS
import './App.css';
//importing the component
```

```
function App() {
  return (
    <div className="App">
      {/* rendering components */}
      <Student/>
    </div>
  );
} export default App;
```
